## Simulation of binaries properties in a* fragmented cluster

Timothé Roland
PhD work with Christian Boily \& Laurent Cambresy

## Introduction

Aim of myPhD: try to simulate the complexity of star forming region (SFR):

M Multiphysical process
> Deal with large to small spatial scales
First work: made with the AMUSÉ platform on binaries
Question: Are stars of the field born in observed SFR?
Difference between the binaries in the field and in SFR:

## The AMUSE code

> Same architecture and interface to use lots of different codes
> Allow to compute multiphysics with the code you want

Code developed in Leiden By Portegies Zwart et al https://github.com/amusecode/amuse
he AMUSE multiple

## module

> Pure Nbody code usually numerically complex
> AMUSE Multiple module:
Top level code
uses different code to model different scale:
( $2+1$ pure Nbody solver)

- one for the whole cluster (top level)
- two for the multiple systems (smallN)

## First basic simulätion

## Initial conditions :

$>$ cluster of 100 stars in a virialized king model
$>$ with canonical IMF
$>\sim 30 \%$ of binaries randomly positionned following observationnal parameters (review of Duchêne and Kraus 2013)

| Mass range | Multiplicity fraction | Mass fraction | Semimajor axis [AU] |
| :---: | :---: | :---: | :---: |
| $\begin{gathered} \text { VLM type } \\ {[0.01 \mathrm{M} \odot ; 0.1 \mathrm{M} \odot]} \end{gathered}$ | $0.22 \pm 0.05$ | $q^{4.2}$ | $\begin{gathered} \log \text { Normal } \\ (\mu=4.5, \log \sigma=0.5) \end{gathered}$ |
| $\begin{gathered} \text { M type } \\ {[0.1 \mathrm{M} \odot ; 0.7 \mathrm{M} \odot]} \end{gathered}$ | $0.26 \pm 0.03$ | $q^{0.4}$ | $\begin{gathered} \text { logNormal } \\ (\mu=5.3, \log \sigma=1.3) \end{gathered}$ |
| $\begin{gathered} \text { Solar type } \\ \text { [0.7M๑; 1.5M๑] } \end{gathered}$ | $0.44 \pm 0.02$ | $q^{0.3}$ | $\begin{gathered} \log \text { Normal } \\ (\mu=45, \log \sigma=2.3) \end{gathered}$ |
| $\begin{gathered} \text { A type } \\ {[1.5 \mathrm{M} \odot ; 5 \mathrm{M} \odot]} \end{gathered}$ | [0.5; 0.7] | $q^{-0.5}$ | logNormal $(\mu=350, \log \sigma=3)$ |
| $\begin{gathered} \text { B type } \\ {[5 \mathrm{M} \odot ; 16 \mathrm{M} \odot]} \end{gathered}$ | [0.6; 0.7] | $q^{-0.5}$ | Uniform(0.15, 15) |
| O type > 16M0 | [0.8, 1] | $q^{-0.5}$ | Uniform(0.15, 15) |

## First basic simulation

Evolution during 20 Myr :
$>$ Unstable system
Lots of collisions in the first Myr:
leads to mass segregation

## First basic simulation

Evolution during 20 Myr :
$>$ Unstable system
Lots of collisions in the first Myr: leads to mass segregation

## First basic simulation

Evolution during 20 Myr :
>Unstable system
Lots of collisions in the first Myr: leads to mass segregation

## First basic simulation

Evolution during 20 Myr :
$>$ Unstable system
$>$ Lots of collisions in the first Myr: leads to mass segregation

## First basic simulätion

## Evolution during 20 Myr :

$>$ Unstable system
>Lots of collisions in the first Myr:

- leads to mass segregation
- Modifies the binaries properties

## Binaries properties

Initial conditions
Primary mass evolution

## Binaries properties

After 10 Myr
Primary mass evolution

## Binaries properties

Initial conditions
Semimajor axis distribution

## Binaries properties

After 10 Myr
Semimajor axis distribution

## Binaries properties

Initial conditions
Eccentricities distribution

## Binaries properties

After 10 Myr
Eccentricities distribution

## Fragmented cluster

Julien Dorval PhD work:
$>$ Adiabatic expansion of a 100k stars cluster (no
hydro)
$>$ leads to fragmentation

Extract cubes of $3-5 \mathrm{k}$ stars and select subgroups with MST method of $\sim 100$ stars.

## Fragmented cluster

> Auto-coherent method to generate initial conditions Mass segregated
Multiplicity rate $\sim 30 \%$

## Fragmented cluster

Initial conditions
Primary mass evolution

## Fragmented cluster

After 10 Myr
Primary mass evolution

## Fragmented cluster

Initial conditions
Semimajor axis distribution

## Fragmented cluster

After 10 Myr
Semimajor axis distribution

## Fragmented cluster

Initial conditions
Semimajor axis distribution

## Fragmented cluster

After 10 Myr
Semimajor axis distribution

## Fragmented cluster

Initial conditions
Eccentricities distribution

## Fragmented cluster

After 10 Myr
Eccentricities distribution

## Summary:

Binary evolution very sensitive in star formation environment
$>$ How precise the observed binary properties distribution are?

## Perspective:

- Add stellar evolution to compute the stars luminosity and extract luminosity maps
Add gas
